

Mosquito Assassin Program

Cooking on the grill, playing with the kids or dogs in the backyard, sitting on the porch enjoying a quiet cup of coffee? The problem is mosquitoes are just waiting for you and your family and they're not just painful, they can be dangerous.

The Mosquito Assassin Program is

- Safe around people, pets and plants.
- Kills up to 90% of your mosquitoes.
- Keeps killing them for months after we leave.
- Only 6 visits can keep them gone all season long.
- We have our own on staff Entomologist.

Is it safe? This is the question we are asked most. How can it be safe to my family, pets and plants if it is so effective at killing mosquitoes. The product we use is a pyrethroid, which is based on chrysanthemum blooms. This is the same product that is used in most flea and tick products for your pets. In fact, we bet many of our customers have stronger chemicals under their sink for cleaning.

How does it work? Pyrethroid works by entering the shell of insects. Since people and pets have skin instead of an exoskeleton, the chemical is not able to absorb in the same way making it completely safe around people and pets. We (and our on staff Entomologist, Dr. Ray Thompson) believe the risk caused by mosquitoes to be much greater than the risk from the pyrethroid.

Will it harm beneficial insects? My plants? No. The main reason is that bees and butterflies do not spend time on the plant's leaves only the blooms. The program also will not harm any plants in your yard since the chemical we use is plant based.

Why is the Mosquito Assassin Program so effective? Adult mosquitoes don't like to be active during the heat of the day. They prefer to hide in shady areas, such as trees, shrubs, tall ground cover and underneath decks. We do our treatments during the day, which means we find most of the mosquitoes while they are hiding. Our technicians often see clouds of mosquitoes billowing out of shady areas when the blower hits it (see photo above.) Nearly all of those mosquitoes will be dead within an hour or so. There will be a residue left over in those areas which means any new mosquitoes that fly in to hang out will be dead in an hour or so too.
